ABSTRACT

This report presents detailed tabulations of data on school enrollment of the civilian non-institutional population in October 1989. It also includes summary time series of data collected since the beginning of the survey. Data are from the October school enrollment supplement to the Current Population Survey (CPS). Data on school enrollment have been collected annually in the CPS since 1946 and reported in this publication series. The data cover enrollment in school from nursery school through graduate or professional education. Data are shown by the following characteristics: (1) age; (2) sex; (3) race; (4) Hispanic origin; (5) marital status; (6) family status; (7) family income; (8) education of the householder; (9) labor force status; (10) metropolitan residence; (11) region; and (12) mother's labor force status and education. Other enrollment characteristics shown are: (1) level and grade of school; (2) public/private school; (3) full-time and part-time attendance status; and (4) two-year/four-year college. Vocational school enrollment is shown separately. Nineteen tables and four graphs present enrollment data. Appendix A contains six supplemental tables. Appendix B lists definitions and explanations, and Appendix C gives the sources and accuracies of estimates and six additional tables. (SLD)

Acknowledgments

This report was prepared in the Education and Social Stratification Branch of the Population Division, under the general direction of **Robert Kominski,** Chief. Overall direction was provided by **Arthur J. Norton,** Assistant Chief, Population Division.

Data collection was conducted by Bureau of the Census field representatives, under the overall direction of **Stanley D. Matchett,** Chief, Field Division. Survey operations and data processing were coordinated by **Ronald R. Tucker, Gregory D. Weyland,** and **Linda A. Seymour.** Programming of tabulations was performed by **Randy J. Gardner,** Demographic Surveys Division. **Andrea E. Adams, D. Darcel Carter,** and **Brenda R. Jeffries** assisted with table and manuscript preparation and with statistical testing. **Suzanne Bianchi,** Housing and Household Economics Statistics Division, and **Paul M. Siegel,** Population Division, reviewed the contents of the report. Statistical review and appendix C were provided by **Caroline A. Riker,** Statistical Methods Division.

The staff of the Administrative and Publication Services Division, **Walter C. Odom,** Chief, provided publication planning, editorial review, design, composition and printing planning and procurement. **Joan I. Kinikin** provided publication cordination and editing.

School Enrollment—Social and Economic Characteristics of Students: October 1989

(Note: The estimates in this report do not reflect the results of the 1990 Census. The Current Population Survey (CPS) estimates are based on population controls from the 1980 census which have been updated for changes in the population since that time. In addition, the CPS and the 1990 census used different procedures for collecting and processing the data.)

INTRODUCTION

This report presents detailed tabulations of data on school enrollment of the civilian noninstitutional population in October 1989. It also includes summary time series of data collected since the beginning of the survey. The data are from the October school enrollment supplement to the Current Population Survey (CPS). Data on school enrollment have been collected annually in the CPS since 1946 and reported in this publication series. The data cover enrollment in "regular school", which includes nursery school, kindergarten, elementary school, high school, and college and professional school. Data are shown by the following characteristics: age, sex, race, Hispanic origin, marital status, family status, family income, education of the householder, labor force status, metropolitan residence, region, and mother's labor force status and education (for preprimary enrollment). Also, the following enrollment characteristics are shown: level and grade of school, public/private school, full-time and part-time attendance status, and two-year/four-year college. Vocational school enrollment is shown separately.

Revisions in edit and tabulation processing have improved data quality, but have made the data beginning with 1987 not strictly comparable to data from earlier years. The previous processing procedures were used from 1967 to 1986. Time series tables in appendix A show two data entries for 1986 which permit comparisons of results according to each set of processing procedures.

HIGHLIGHTS

(Figures shown in parentheses define 90-percent confidence intervals. For details of calculation see "Appendix B, Source and Accuracy of the Estimates.")

- In October 1989, 61.5 (±.7) million persons were enrolled in regular school - nursery school through college. About 59.2 (±.5) million of these persons were between the ages of 3 and 34.
- The number of persons in nursery school or kindergarten was 6.7 (±.1) million, which was not statistically different from the 6.6 (±.1) million enrolled in the fall of 1988.
- Elementary school enrollment (grades 1-8) stood at 28.7 (±.2) million persons, up from 28.2 (±.2) million one year earlier.
- High school enrollment totalled 12.9 (±.1) million persons, a statistically significant change from the 13.1 (±.1) million in 1988.
- The annual high school dropout rate (from grades 10-12) for 1989 was 4.5 (±.6) percent, not statistically different from the 1988 rate of 4.8 (±.6) percent.
- The number of persons enrolled in college totalled 13.2 (±.3) million, which was not different from the 13.1 (±.3) million enrolled one year before. About 2.1 (±.1) million of current college students were over age 34.

SCHOOL ENROLLMENT IN 1989

Preprimary Enrollment

About 54.6 percent of children ages 3 to 5 years old (6,026,000) were enrolled in preprimary school in the fall of 1989. Figure 1 shows the level of preprimary enrollments since 1970. Of the 39.1 percent of children 3 or 4 years old who were in school, most were in nursery school (2.6 million of 2.9 million total enrollees). Given the availability of public kindergarten in all states, most 5 year olds were enrolled in school (91.8 percent), the majority in kindergarten (79.2 percent). There is no difference in preprimary enrollment levels for Whites (55 percent) and Blacks (54.2 percent), but the level for Hispanic children (who can be of any race) was significantly lower (41.6 percent).

A large difference in nursery school enrollment is observed when examined across family income groups. Table A shows that 22.6 percent of young children (ages 3 to 4)

[1]May be of any race.

from families with income less than $20,000 were enrolled in nursery school, compared to 32.9 percent for children from families with income between $20,000 and $39,999. Children from families with income $40,000 and above had the highest level of nursery school enrollment (52.5 percent).

Of the 3 and 4 year olds enrolled in nursery school, 801,000 (31.3 percent) were in public school, while 1,762,000 (68.7 percent) attended private school. Family income appears strongly associated with patterns of public and private nursery schooling. Children from families with high income are more likely to attend private school, while those from lower income families are more likely to enroll in public systems. Three-fifths of the nursery school students from families with income less than $20,000 attended public school, as opposed to less than one-fifth of those from families with income over $40,000.

There continues to be some question as to whether nursery school acts as child care. As table B shows, the children of women in the labor force were slightly more likely to be enrolled in nursery school than those of women who were not (37.7 versus 31.3 percent). More substantial, however, is the difference in the use of full-day nursery school. About 44 percent of nursery school students with a mother in the labor force were full-day, compared to just 14 percent of nursery school students whose mother was not in the labor force. However, while nursery school and full-day enrollments are higher for the children of mothers employed or looking for work, the majority of 3 and 4 year old children are not enrolled in nursery school at all, regardless of whether their mother is in the labor force or not.

Elementary and Secondary School Enrollment

There were 28.7 million persons enrolled in elementary school (grades 1 through 8) in the fall of 1989. Given the near universal nature of schooling for young persons, the number of persons enrolled in elementary school closely parallels the size of the population between 6 and 13 years of age, as shown in Figure 2. During the 1970's and early 1980's, elementary school enrollments fell, following the general decrease in the size of the 6 to 13 year old population. In the past few years, however, this has changed, as both the population and enrollments have risen. The plot of middle-series projections for children ages 6 to 13 indicates that school enrollments may continue to rise over the next several years.[1]

Most elementary school students attend public institutions, as the top panel of table C shows. In the fall of 1989, about 9.7 percent of all elementary school students ages 3 to 17 were in private schools, but the data indicate that private school enrollment is more likely for children from families with higher family income. Whereas 5 percent of children from families with income less than $20,000 attended private school, 15 percent of those from families with income of $40,000 or more did so.

In the fall of 1989, about 12.9 million persons were enrolled at the high school level (grades 9 through 12). Figure 3 shows the strong correspondence between high school enrollments and the population between the ages of 14 and 17. During the last five years, the number of persons in high school fell as the size of the population ages 14 to 17 also dropped. Middle-series projections of 14 to 17 year olds indicate that high school enrollments will rise over the next few years, if enrollment rates remain the same.

Public institutions account for most high school enrollments, with just 6.6 percent of secondary students attending private schools. The bottom half of table C shows public and private high school enrollment levels by income, race and Hispanic origin groupings. As with primary school, there is a relationship between family income and private school enrollment. About 3.1 percent of children from lower income (less than $20,000) families attended private high school, compared to 10.1 percent from higher income families.

High School Dropouts

During the one year period from October 1988 to October 1989, about 404,000, or 4.5 percent, of all students in the 10th, 11th or 12th grade dropped out of high school.[2] While this overall national dropout rate is considerably lower than the level of 6.7 percent just ten years earlier (see table A-3), variation among different subpopulations is apparent.

The data in table D show that the high school dropout rate of 3.9 percent for Whites is significantly lower than the Black rate of 7.7 percent. Across family income groups there are also differences in the dropout rate. While 8 percent of high school students from families with income below $20,000 dropped out of high school, just 1.1 percent of those from families with incomes of $40,000 or more left school before graduation.

A different measure of high school dropouts is the proportion of persons who are no longer enrolled and have not completed high school. This "dropout pool" measure is to some extent a summary of the year-to-year dropout rates (and reenrollment) over the life of a cohort. Data from Table 1 show that among persons ages 18 to 24 years old, 3.6 million (14.4 percent) were high school dropouts. Men had a slightly higher proportion of dropouts than women (15.7 vs. 13.2 percent). Blacks had a slightly higher level than Whites (16.4 vs. 14.1 percent), while the level for Hispanics was 37.7 percent.

[1]Current Population Report, Series P-25, No. 1018, Projections of the Population of the United States by Age, Sex, and Race: 1988 to 2080.

[2]The annual high school dropout rate was first presented in Current Population Reports, Series P-20, No. 413, School Enrollment Social and Economic Characteristics of Students: October 1983. Details of its calculation are presented in that report, as well as in Appendix B, Definitions and Explanations, of this report.

[1]May be of any race.

College Enrollment

In October 1989, 13,180,000 persons were enrolled in colleges across the nation. Figure 4 shows the level of college enrollments since 1972, along with the number of persons ages 18 to 24, the "traditional" college age group. While this traditional college age population declined by 2.7 million persons in the past ten years, the number of college students rose by 1.8 million, largely reflecting the increase in college enrollment by persons ages 25 and older.

Table E details some of the basic characteristics of college students in 1989; these data illustrate the diverse nature of the college population. As can be seen in the age detail, 39.4 percent of all college students were age 25 or older; 16 percent were over age 34. Women accounted for 54.9 percent of college students. There were 10.7 million students enrolled at the undergraduate level, and 66 percent of them were enrolled in four-year institutions. The majority of students (64.1 percent) were enrolled full-time, and 78.1 percent were enrolled in a public college or university. Finally, 61.6 percent of all college students were employed either full- or part-time.

For many persons, college enrollment must be negotiated among forces such as employment, cost and many life-cycle factors. Table F shows the proportion of students attending full-time at two-year and four-year institutions, by the age of the student. In general, a much larger proportion of students at four-year schools attend full-time, but there is also a strong relationship between age and full-time attendance. While 91.9 percent of traditional age college students in four-year schools are attending full-time, just 18.9 percent of persons age 35 or older in two-year schools are full-time.

Another closely related factor in college attendance is the employment status of the individual. As the table G shows, 47.4 percent of all full-time students held a job, usually as a part time worker. By contrast, 87.1 percent of students attending school part-time were working, and the majority of these persons held a full-time job. While for some persons the level of involvement at school may influence the degree of labor force activity, for other persons full-time work may be the determining force in the amount of time one can devote to school.

DATA FILES AVAILABLE

The time series tabulations of enrollment shown in Tables A1 through A6 in Appendix A are now available on two floppy diskettes. The tables are available as either six ASCII print files, or six LOTUS 1-2-3 © files (version 2.1). Users wishing to purchase files should specify which data format they prefer (ASCII or LOTUS), include a check for $25 (make checks payable to "Commerce-Census") and send to:

Table E. Characteristics of the College Population: October 1989

(Numbers in thousands)

Characteristic	Total population	Enrolled in college	Type of school			Percent full time	Percent public school	Percent employed		
			2-year college	4-year college	Graduate school			Total	Full time	Part time
Total	190,143	13,180	3,627	7,034	2,520	64.1	78.1	61.6	32.1	29.5
Male	90,694	5,950	1,464	3,266	1,219	68.3	76.5	60.8	33.3	27.5
Female	99,449	7,231	2,163	3,768	1,300	60.8	79.4	62.3	31.0	31.2
White	162,262	11,243	3,064	6,001	2,179	63.2	77.9	63.8	33.0	30.9
Black	21,625	1,287	417	729	142	68.3	81.0	47.2	28.4	18.8
Hispanic origin[1]	14,302	754	359	318	76	60.1	86.7	65.5	37.3	28.2
15 to 19 years old	17,381	3,249	1,048	2,202	-	92.0	79.0	45.7	8.1	37.6
20 to 21 years old	6,828	2,570	557	1,972	40	87.2	76.1	53.3	13.7	39.5
22 to 24 years old	11,072	2,168	467	1,191	509	69.0	78.5	63.3	30.8	32.5
25 to 34 years old	42,849	3,081	880	1,041	1,161	38.3	76.2	75.4	54.1	21.3
35 years and older	112,014	2,112	676	628	809	26.0	81.4	74.5	60.4	14.1

[1]May be of any race.

Table F. Full-time Enrollment by Age and Type of College: October 1989

(Numbers in thousands)

Age	All colleges		2-Year colleges		4-Year colleges		Graduate school	
	Total students	Percent full time	Total students	Percent full time	Total students	Percent full time	Total students	Percent full time
Total	13,180	64.1	3,627	47.6	7,034	79.5	2,520	45.2
15 to 24 years old	7,987	84.2	2,072	67.0	5,365	91.9	549	74.3
25 to 34 years old	3,081	38.3	880	23.9	1,041	42.7	1,161	45.2
35 years and over	2,112	26.0	676	18.9	628	33.9	809	25.7

Table G. Employment Status by Full-time/Part-time Enrollment and Type of College: October 1989

(Numbers in thousands)

Characteristic	All colleges	2-year colleges	4-year colleges	Graduate schools
Full-time students	8,455	1,725	5,589	1,140
Percent employed	47.4	57.5	43.6	50.4
Percent full time	9.4	13.6	6.9	15.1
Percent part time	38.0	43.9	36.8	35.3
Part-time students	4,725	1,902	1,444	1,380
Percent employed	87.1	84.2	86.1	92.2
Percent full time	72.7	68.9	69.3	81.4
Percent part time	14.4	15.3	16.8	10.8

[1]Controlled to 1980 census base population estimates.
[2]Controlled to 1970 census base population estimates.
[3]Data are for Black and other races.
[4]Persons of Hispanic origin may be of any race.

Note: 1986 data are shown for the old and new processing system. Improvement in edits and population estimation procedures caused slight changes in the estimates.

Table A-2. **Percentage of Persons 3 to 34 Years Old Enrolled in School, by Age, Sex, Race, and Hispanic Origin: October 1947 to 1989**

(Civilian noninstitutional population. For meaning of symbols, see text)

Years, race, and Hispanic origin	Total enrolled	Age										
		3 and 4 years	5 and 6 years	7 to 9 years	10 to 13 years	14 and 15 years	16 and 17 years	18 and 19 years	20 and 21 years	22 to 24 years	25 to 29 years	30 to 34 years

[1]Controlled to 1980 census based population estimates.
[2]Controlled to 1970 census based population estimates.
[3]Data are for Black and other races.
[4]Data are adjusted to include Black only.
[5]Persons of Hispanic origin may be of any race.

Note: 1986 data are shown for the old and new processing system. Improvements in edits and population estimation procedure caused slight changes in the estimates.

Table A-3. Annual High School Dropout Rates by Sex, Race, Grade, and Hispanic Origin: October 1967 to 1989

(Numbers in thousands. Civilian noninstitutional population)

Appendix B. Definitions and Explanations

Population coverage. The figures in this report for October 1989 are sample survey data and related to the civilian noninstitutional population of the 50 States and the District of Columbia. The estimation procedure used for this survey involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, sex, race, and Hispanic origin. These independent estimates are based on civilian noninstitutional population counts from the decennial censuses and are updated with statistics on births, deaths, immigration, and emigration and statistics on the strength of the Armed Forces. Data published for 1972 through 1980 were based on independent population estimates derived by updating the 1970 decennial census counts. Starting with the data collected in the October 1981 Current Population Survey (CPS), independent estimates were based on civilian noninstitutional population controls for age, race, and sex established by the 1980 decennial census. The April 1980 census population count differed somewhat from the independent estimates for April 1980 derived by updating 1970 census population figures. The April 1980 census count of the civilian noninstitutional population was 222,420,441, compared with the 1970 census-based figure of 217,400,244 used for the CPS. Basically, this difference had little impact on summary or proportional measures, such as medians and percent distributions; however, use of the new controls could have had significant effect on the absolute numbers.

School enrollment. The school enrollment statistics from the current survey are based on replies to the interviewer's inquiry whether the person was enrolled in regular school. Interviewers were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year in any type of public, parochial, or other private school in the regular school system. Such schools include nursery schools, kindergartens, elementary schools, high schools, colleges, universities, and professional schools. Attendance may be on either a full-time, or part-time basis and during the day or night. Regular schooling is that which may advance a person toward an elementary or high school diploma, a college, university, or professional school degree. Children enrolled in nursery schools and kindergarten are included in the enrollment figures for regular schools and are also shown separately.

Enrollment in schools which are not in the regular school system, such as trade schools, business colleges, and schools for the mentally handicapped, which do not advance students to regular school degrees, is not included.

Persons enrolled in classes which do not require physical presence in school, such as correspondence courses or other courses of independent study, and in training courses given directly on the job, are also excluded from the count of those enrolled in school, unless such courses are being counted for credit at a regular school.

Level of school. The statistics on level of school indicate the number of persons enrolled at each of five levels—nursery school, kindergarten, elementary school (1st to 8th grades), high school (9th to 12th grades), and college or professional school. The last group includes graduate students in colleges or universities. Persons enrolled in elementary, middle school, intermediate school or junior high school through the eighth grade are classified as in elementary school. All persons enrolled in 9th through 12th grade are classified as in high school.

Nursery school. A nursery school is defined as a group or class that is organized to provide educational experiences for children during the year or years preceding kindergarten. It includes instruction as an important and integral phase of its program of child care. Private homes in which essentially custodial care is provided are not considered nursery schools. Children attending nursery school are classified as attending during either part of the day or the full day. Part-day attendance refers to those who attend either in the morning or in the afternoon, but not both. Full-day attendance refers to those who attend in both the morning and the afternoon.

Head Start. Children enrolled in Head Start programs or similar programs sponsored by local agencies to provide preschool education to young children are counted under nursery school or kindergarten as appropriate.

Public or private school. In this report, a public school is defined as any educational institution operated by publicly elected or appointed school officials and supported by public funds. Private schools include educational institutions estab lished and operated by religious

bodies, as well as those which are under other private control. In cases where enrollment was in a school or college which was both publicly and privately controlled or supported, enrollment was counted according to whether it was primarily public or private.

Modal grade. Enrolled persons are classified according to their relative progress in school: that is, whether the grade or year in which they were enrolled was below, at, or above the modal (or typical) grade for persons of their age at the time of the survey. The modal grade is the year of school in which the largest proportion of students of a given age is enrolled.

Annual High School Dropout Rate. The annual high school dropout rate is an estimate of the proportion of students who drop out of school in a single year. Table A-3 presents estimates of the annual dropout rate for various groups since 1967. This section briefly explains

Basic School Enrollment Supplement

(Questions included in the October CPS since 1967)

29. CHECK ITEM
School enrollment status *(Transcribe from 26a)*
Yes ○ / No ○ *(VERIFY 30)*

how the annual dropout rate is calculated; for further explanation and details of its derivation see CPR Series P-20, No. 413, School Enrollment—Social and Economic Characteristics of Students: October 1983.

Annual dropout rates for a single grade(x) are estimated as the ratio of the number of persons who were enrolled in grade(x) in the year preceding the survey, did not complete grade(x) and are not currently enrolled, to the number enrolled in grade(x) at the start of the year preceding this survey. Persons reported as enrolled last year but not currently enrolled are presented in table 8 by the highest grade completed and are presumed to have dropped out of the succeeding grade (except those who graduated this year). Thus, individuals counted as 10th grade dropouts are those not enrolled in school whose highest grade completed is the 9th grade. (They include not only those persons who were enrolled in the 10th grade in the fall of the year preceding the survey and left school without completing the year, but also those persons who finished the 9th grade in the spring preceding the survey and were not enrolled at the survey date.) These estimates form the numerator of estimates of the annual grade specific dropout rate.

Persons currently enrolled in high school are presumed to have successfully completed and been enrolled in the preceding grade in the preceding year. Thus, those who have successfully completed the 10th grade are enrolled in the 11th grade. Along with the persons who dropped out of that grade, they comprise the denominator of the estimate of the annual grade-specific dropout rate.

$$\text{Dropout from grade } n = \frac{\text{Not enrolled and highest grade completed} = n\text{-}1}{\text{Enrolled in grade } n+1 \; + \; \text{Not enrolled and highest grade completed} = n\text{-}1}$$

Since persons who complete the 12th grade cannot be presumed to enroll in college, the estimate of the number of persons enrolled in the 12th grade one year prior to the survey is constructed as the sum of the number of persons reported as having graduated from high school "this year" in table 8 (both those enrolled in the first year of college and persons not currently enrolled whose highest grade completed is the 12th grade) and those persons not currently enrolled who were enrolled last year and whose highest grade completed is the 11th grade (dropouts).

The annual dropout rate for all grades during one year can be obtained by summing the components of the rates for the individual grades. In other words, those persons who were enrolled in the tenth, eleventh, or twelfth grade last year and who are not currently enrolled and do not have a diploma. The following chart shows the components of the annual dropout rate calculation for each grade.

Dropped out of grade	Numerator	Denominator	
	Not currently enrolled and highest grade =	Current grade in which enrolled =	Not currently enrolled and highest grade =
10	9	11	9
11	10	12	10
12	11	College 1 + (not enrolled, completed 12 and graduated this year)	11

In addition to the annual rate, two other estimates of dropouts are frequently used. The annual dropout rate is different from a "pool" (or status) measure such as the proportion of an age group who are high school dropouts (not enrolled in school, not high school graduates, shown in table 1), which does not depend on when the individuals dropped out.

A third measure of dropouts is the cohort measure, most commonly from a longitudinal study, in which one calculates the proportion of a specific group of people enrolled in a specific year, who had not received diplomas (and who were no longer in school) some years later. For example, the proportion of a cohort enrolled in ninth grade in year X, who were not enrolled and had not received a diploma by year X+4.

College enrollment. The college enrollment statistics are based on replies to the interviewer's inquiry as to whether the person was attending or enrolled in college. Interviewers were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year, except those who have left for the remainder of the term. Thus, regular college enrollment includes those persons attending a 4-year or 2-year college, university, or professional school (such as medical or law school) in courses that may advance the student toward a recognized college or university degree (e.g., BA or MA). Attendance may be either full time or part time, during the day or night. The college student need not be working toward a degree, but he/she must be enrolled in a class for which credit would be applied toward a degree. (see "school enrollment")

Two-year and four-year colleges. College students were asked to report whether the college in which they were enrolled was a 2-year college (junior or community college) or a 4-year college or university. Students enrolled in the first 4 years were classified by the type of college they reported. Type of college is shown in tables for undergraduates only. Graduate students are shown as a separate group.

Revisions in processing and tabulations have resulted in data not strictly comparable to that published for earlier years. In tabulations for years prior to 1987, students in the fourth academic year of college were

assumed to be in a 4-year college or university regardless of the type of college they reported (74,000 fourth-year students were reported enrolled in 2-year colleges in 1986 on the questionnaire but included in 4-year colleges in the tabulations). Also before 1987, type of college was not allocated for students who did not report (about 250,000 students in the first to third year in 1986). Revised edit and allocation procedures for 1987 and 1988 increased the estimated number of college students, which also increased the numbers of persons reported in 2-year and 4-year colleges. The following table shows data for 1986 using both the revised and old processing and tabulation systems. The differences are due to procedural changes rather than real change:

Undergraduates (X 1000)	Revised	Old	Difference
14 to 34 years old	9,098	8,972	126
2-year college	3,087	2,831	256
4-year college	6,011	5,892	119
Type not reported	000	249	-249

Full-time and part-time attendance. College students were classified, in this report, according to whether they were attending school on a full-time or part-time basis. A student was regarded as attending college full time if he/she was taking 12 or more hours of classes during the average school week, and part time if he/she was taking less than 12 hours of classes during the average school week.

School enrollment in year preceding current survey. An inquiry on enrollment in regular school or college in October of the preceding year was asked for all persons (enrolled and not enrolled). In years before 1988, the question was asked only of persons who were not currently attending regular school or were enrolled in college. In the tabulations of persons enrolled in secondary school in the previous year, persons currently enrolled in high school are assumed to have been enrolled the previous year.

Vocational school enrollment. Vocational school enrollment includes enrollment in business, vocational, technical, secretarial, trade, or correspondence courses which are not counted as regular school enrollment and are not for recreation or adult education classes. Courses counted as college enrollment should not also be included as vocational.

Comparability of enrollment data in previous years. Changes in the edit and tabulation packages used in processing the October CPS school enrollment supplement have caused some minor revisions in the estimates. The current edit and tabulation package began with 1987 data. The 1986 data which were published in CPR series P-20 No. 429, were reprocessed with the rewritten programs in order to clarify comparability. Tables A-1 to A-6 contain enrollment data in time series. In each table, there are two presentations for 1986. The original was from the edit and tabulation package used for this data series from 1967 to 1986. The revised version (1986R) will be used from 1987 until a new tabulation package is written.

Major changes in the data due to the edit revisions are:

a. Among 14- and 15-year-olds, an edit improvement allowed persons with enrollment data not reported who were previously automatically imputed "not enrolled" to be enrolled.

b. Revisions in tabulation of enrollment in the previous year simplifies calculation of an annual high school dropout rate.

c. Edit improvements caused increases in college enrollment estimates, most notably above age 24; this age group was largely ignored in earlier edits.

d. Type of college is fully allocated (discussed earlier).

e. Tabulations of type of college are available by race.

f. Dependent family member is defined consistently.

g. New data on employment status, vocational course enrollment, college retention and re-entry, and families with children enrolled in public and private school are available.

Age. The age classification is based on the age of the person at his/her last birthday.

Race. The population is divided into three groups on the basis of race—White, Black, and other races. The last category includes American Indians, Japanese, Chinese, other Asian and Pacific Islanders, and any other race except White and Black. In this report, other races is not shown separately.

Hispanic origin. Information on origin or descent was obtained by asking, "What is (this person's) origin or descent?" Responses generally refer to a person's perceived national or ethnic lineage and do not necessarily indicate the country of his/her birth or that of his/her parents.

Persons of Hispanic origin are persons who reported themselves as Mexican American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Hispanic origin. However, all persons who reported themselves as Mexican American, Chicano, Mexican, or Mexicano were combined into the one category—Mexican. Persons of Hispanic origin may be of any race.

Marital status. The marital status category shown in this report, "married, spouse present," includes persons who are currently married and living with their spouse. The category "never married" is self-explanatory. The category "other marital status" includes persons who are separated, divorced, or widowed.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Family. A family (also referred to in this publication as a primary family) is a group of two persons or more (one of whom is the householder), related by birth, marriage, or adoption and residing together; all such persons are considered members of one family.

Householder. The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Prior to 1980, the husband was always considered the householder in married-couple households. The number of householders is equal to the number of households. Also, the number of family householders is equal to the number of families.

Family householder. The family member who is also the householder (the person or one of the persons who maintain the household), or reference person, is the family householder.

Head versus householder. Beginning with the 1980 census, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" were used. Recent social changes resulted in greater sharing of household responsibilities among the adult members and, therefore, made the term "head" inappropriate in the analysis of household and family data. Specifically, the Bureau reconsidered its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

In this report, the term "householder" is used in the presentation of data that had previously been presented with the designation "head." The householder is the first adult household member listed on the questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If a home is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of other household members is to be recorded.

The practice of using the term "head of family" or "family head", to refer to the person maintaining the household, was discontinued in CPS surveys conducted after the 1980 Census of Population. In surveys taken prior to the 1980 Census of Population, husbands in husband-wife families were always classified as "family heads." Women were only "family heads" if no spouse was present. The person who maintains the household is now called the "family householder."

Dependent family member. In theory, a dependent family member is one who is financially dependent on the householder. In these data a dependent family member is a primary family member, under 25 years old, who is an own child, brother/sister, or other relative (not parent) of the householder, and is not "married, spouse present."

In analyses of data on college enrollment by family income for earlier years, persons who were primary family members, 18 to 24 years old, and not "married, spouse present" were often treated as dependent family members, although not labelled as such and including some householders (e.g. "other marital status" in table 13 of CPR Series P-20, No. 429.) The family income reported for dependent family members is presumed to be that of the parental family; for others, it is presumed to be that of the individual and his/her spouse. In tables 15 and 34, persons labeled "dependent family member" and "other marital and family status" combined are equivalent to persons labeled "other marital status" in table 13 of CPR Series P-20, No. 429. Persons who are "other marital and family status" in this report are the family householders who are not "married, spouse present."

Years of school completed. Data on years of school completed were derived from the combination of answers to two questions: (1) "What is the highest grade of school he/she has ever attended?" and (2) "Did he/she finish this grade?" The questions on educational attainment apply only to progress in "regular" schools. Such

schools include graded public and private (including parochial) elementary and high schools (both junior and senior high), colleges, universities, and professional schools whether day schools or night schools. (See "school enrollment" for definition of "regular" school.) Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Labor force status.

In the labor force. The definition of labor force and employment status relates to the population 15 years old and over. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. Data tabulated from the October CPS are for the civilian population only.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force."

Employed. Employed persons comprise (1) all civilians who, during the survey week containing October 12, did any work at all as paid employees or in their own business or profession, on their own farm, or in a business operated by a member of the family and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations

Unemployed. Unemployed persons are those civilians who, during the survey week had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off, or (3) were waiting to report to a new wage or salary job within 30 days.

Full-time and part-time employment. Persons who worked 35 hours or more during the survey week and those who worked 1 to 34 hours but usually work full time are classified as employed full time. Part-time workers are persons who worked 1 to 34 hours during the survey week and usually work only 1 to 34 hours. Persons with a job but not at work during the survey week are classified according to whether they usually work full time or part time.

Family income. In this report, family income is derived from a single question asked of the household respondent when a household first enters the sample and is updated on the 1-year anniversary of entry. Income includes money income from jobs; net income from business, farm, or rent; pensions; dividends; interest; social security payments; and any other money income. The income of nonrelatives living in the household is excluded, but the income of all family members 14 years old and over, including those temporarily living away, is included. It should be noted that while characteristics of the person, such as age and marital status, and the composition of families refer to the date of the interview, family income statistics refer to receipts over a 12-month period starting 12 to 16 months prior to the interview.

The income tables include in the lowest income group those who were classified as having no income in the 12-month reference period and those reporting a loss in net income from farm and nonfarm self-employment or in rental income.

The detailed income tables include a separate category ("not reported") for families for which no income information was obtained. In most other CPS's showing income data, the missing income data have been allocated.

The money income level of families shown in this report may be somewhat understated. Income data from the October control card are based on the respondent's estimate of total family money income in broad, fixed income intervals. Income data collected in the March supplement to the CPS are based on responses to 11 direct questions asked about each person 14 years old and over and identifying 23 different sources of income in the preceding calendar year. Previous research has shown that the use of broad income intervals to record money income tends to reduce the rate of nonresponse, while increasing the likelihood that the amounts reported will be significantly understated as compared with results from more detailed questions.

Metropolitan-nonmetropolitan residence. The population residing in metropolitan statistical areas (MSA's) constitutes the metropolitan population. MSA's are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. An MSA is a geographic area consisting of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. The definitions specify a boundary around each large city so as to

include most or all its suburbs. Entire counties form the MSA building blocks, except in New England where cities and towns are used. The former term, SMSA, was changed to MSA in 1983.

An area qualifies for recognition as an MSA if (1) it includes a city of at least 50,000 population, or (2) it includes a Census Bureau-defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). In addition to the county containing the main city or urbanized area, an MSA may include other counties having strong commuting ties to the central county. If specified conditions are met, certain large MSA's are designated as consolidated MSA's (CMSA's) and divided into component primary MSA's (PMSA's).

Central cities. The largest city in each MSA is always designated a central city. There may be additional central cities if specified requirements, designed to identify places of central character within the MSA, are met. Although the largest central cities are generally included in the title of the MSA, there may be central cities that are not part of the title. The balance of the MSA outside the central city or cities often is regarded as equivalent to "suburbs."

In July 1985, the CPS began carrying the metropolitan statistical area definitions announced by the Office of Management and Budget on June 30, 1984. Figures published from the CPS in the early 1980's and throughout most of the 1970's referred to metropolitan areas as defined on the basis of the 1970 census. Since there are important differences in the population classified as metropolitan using the 1970 and 1984 definitions, comparisons should be avoided.

Comparability of metropolitan estimates. The new CPS metropolitan estimates have consistently been higher than independent estimates of the metropolitan population prepared by the Census Bureau; the new CPS nonmetropolitan estimates have been lower than the independent estimates. For example, between July 1985 and August 1986, the magnitude of the monthly differences varied from 900,000 to 2.5 million persons, so that the proportion of the population living in metropolitan areas according to the CPS has ranged from 0.4 to 1.0 percentage points higher than the independent estimate. The difference in level between the two sets of estimates is partially attributable to the basic CPS sample design, which, because of sampling variability, includes an oversample of metropolitan households and an undersample of nonmetropolitan households. The monthly variations result from the exit and entrance of rotation groups, each with slightly different metropolitan-nonmetropolitan pro portions, into the sample. The apparent overestimation of metropolitan and underestimation of nonmetropolitan population in the CPS relative to the Bureau's independent estimates should be taken into account when using the data.

Geographic regions. The four major regions of the United States, for which data are presented, represent groups of States, as follows:

Northeast— Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

Midwest[1]*—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.*

South— Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West— Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Symbols. The following symbols are used throughout the tables:

-	Represents zero or rounds to zero.
B	The base of the derived figure is less than 75,000.
X	Not applicable
NA	Not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals which are independently rounded. With few exceptions, percentages are based on the rounded absolute numbers.

[1]Formerly North Central.

Appendix C. Source and Accuracy of Estimates

SOURCE OF DATA

Most estimates in this report come from data obtained in October 1989 from the Current Population Survey (CPS). Some estimates are based on data obtained from the CPS in earlier years. The Bureau of the Census conducts the survey every month, although this report uses only October data for its estimates. The October survey uses two sets of questions, the basic CPS and the supplement.

Basic CPS. The basic CPS collects primarily labor force data about the civilian noninstitutional population. Interviewers ask questions concerning labor force participation about each member 15 years old and over in every sample household.

The October 1989 CPS sample was selected from the 1980 Decennial Census files with coverage in all 50 states and the District of Columbia. The sample is continually updated to account for new residential construction. It is located in 729 areas comprising 1,973 counties, independent cities, and minor civil divisions. About 56,100 occupied households are eligible for interview every month. Interviewers are unable to obtain interviews at about 2,500 of these units because the occupants are not home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Bureau of the Census has redesigned the CPS sample several times to improve the quality and reliability of the data and to satisfy changing data needs. The most recent changes were completely implemented in July 1985.

The table in the next column summarizes changes in the CPS designs for the years for which data appear in this report.

October Supplement. In addition to the basic CPS questions, interviewers asked supplementary questions in October about school enrollment for all household members 3 years old and over.

Estimation Procedure. This survey's estimation procedure inflates weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, sex, race, and Hispanic/non-Hispanic categories. The independent estimates were based on statistics from decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the size of the Armed Forces. The independent population estimates used for 1981 (1980 for income estimates) to present were based on updates to controls established by the 1980 Decennial Census. Data previous to 1981 were based on independent population estimates from the most recent decennial census. For more details on the change in independent estimates, see the section entitled "Introduction of 1980 Census Population Controls" in an earlier report (Series P-60, No. 133).

Description of the October Current Population Survey

Time period	Number of sample areas	Housing units eligible	
		Interviewed	Not Interviewed
1988 to 1989	729	53,600	2,500
1985 to 1987	729	57,000	2,500
1984	[1]629/729	57,000	2,500
1981 to 1983	629	59,000	2,500
1980	629	65,500	3,000
1978 to 1979	614	55,000	3,000
1972 to 1977	461	46,500	2,500
1971	449	45,000	2,000
1967 to 1970	449	48,000	2,000
1963 to 1966	357	33,500	1,500
1960 to 1962	333	33,500	1,500
1957 to 1959	330	33,500	1,500
1954 to 1956	230	21,000	500-1,000
1947 to 1953	68	21,000	500-1,000

[1]The CPS was redesigned following the 1980 Decennial Census of Population and Housing. During phase-in of the new design, housing units from the new and old designs were in the sample.

The estimates in this report for 1985 and later also employ a revised survey weighting procedure for persons of Hispanic origin. In previous years, weighted sample results were inflated to independent estimates of the noninstitutional population by age, sex, and race. There was no specific control of the survey estimates for the Hispanic population. Since then, the Bureau of the Census developed independent population controls for the Hispanic population by sex and detailed age groups. Revised weighting procedures incorporate these new controls. The independent population estimates include some, but not all, undocumented immigrants.

ACCURACY OF THE ESTIMATES

Since the CPS estimates come from a sample, they may differ from figures from a complete census using

the same questionnaires, instructions, and enumerators. A sample survey estimate has two possible types of errors: nonsampling and sampling. The accuracy of an estimate depends on both types of errors, but the full extent of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or on small differences between estimates. The standard errors for CPS estimates primarily indicate the magnitude of sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimates and the desired value.)

Nonsampling Variability. Nonsampling errors can be attributed to many sources. These sources include the inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, respondents' inability or unwillingness to provide correct information or to recall information, errors made in data collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

CPS undercoverage results from missed housing units and missed persons within sample households. Compared to the level of the 1980 Decennial Census, overall CPS undercoverage is about 7 percent. CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-sexrace-Hispanic population controls partially corrects for the bias due to undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-raceHispanic group. Furthermore, the independent population controls have not been adjusted for undercoverage in the 1980 census.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey,* Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology,* Bureau of the Census, U.S. Department of Commerce.

Sampling Variability. Sampling variability is variation that occurred by chance because a sample was surveyed rather than the entire population. Standard errors, as calculated by methods described later in *"Standard Errors and Their Use,"* are primarily measures of sampling variability, although they may include some nonsampling error.

Comparability of Data. Data obtained from the CPS and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Use caution when comparing results from different sources.

Caution should also be used when comparing estimates in this report, which reflect 1980 census-based population controls, with estimates for 1980 and earlier years, which reflect 1970 censusbased population controls. This change in population controls had relatively little impact on summary measures such as means, medians, and percentage distributions, but did have a significant impact on levels. For example, use of 1980 based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for data collected in 1981 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Since no independent population control totals for persons of Hispanic origin were used before 1985, compare Hispanic estimates over time cautiously.

Note When Using Small Estimates. Summary measures (such as medians and percentage distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, summary measures would probably not reveal useful information when computed on a smaller base. However, estimated numbers are shown even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates permit combinations of the categories to suit data users' needs. Take care in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Standard Errors and Their Use. A number of approximations are required to derive, at a moderate cost, standard errors applicable to all the estimates in this report. Instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. Thus, the tables show levels of magnitude of standard errors rather than the precise standard errors.

The sample estimate and its standard error enable one to construct a confidence interval, a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Some statements in the report may contain estimates followed by a number in parentheses. This number can be added to and subtracted from the estimate to calculate upper and lower bounds of the 90-percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent (±1.0)," the 90-percent confidence interval for the estimate, 1.7 percent, is 0.7 percent to 2.7 percent.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in this report is that the population parameters are different. An example of this would be comparing the percentage of 18 to 24 year old high school graduates in 1989 to that in 1979.

Tests may be performed at various levels of significance, where a significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better. This means that the absolute value of the estimated difference between characteristics is greater than or equal to 1.6 times the standard error of the difference.

Standard Errors of Estimated Numbers. There are two ways to compute the approximate standard error, s_x, of an estimated number shown in this report. The first uses the formula

$$s_x = fs$$

where f is the appropriate factor from table C-4 and s is the standard error of the estimate obtained by interpolation from table C-1 or C-2. The second method uses formula (2), from which the standard errors in tables B-1 and B-2 were calculated. This formula will provide more accurate results than formula (1).

$$s_x = \sqrt{-(b/T)X^2 + bx}$$

Here x is the size of the estimate, T is the total number of persons in a specific age group and b is the parameter in table C-4 associated with the particular type of characteristic. If T is not known, for Total or White use 100,000,000; for Blacks and Hispanic use 10,000,000. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters for the characteristic which will give the largest standard error.

Illustration. Table 1 shows there were 2,898,000 3 and 4 year olds enrolled in school and 7,405,000 children in that age group in October 1989. Using formula (1) with f = 1.1 from table C-4, and s = 67,000 from table C-1, the approximate standard error of the number of 3 and 4 year olds enrolled in school is

$$s_x = (1.1)(67{,}000) = 74{,}000$$

The value of s was obtained by linear interpolation in two directions. The first interpolation was between 5,000,000 and 10,000,000 total persons for both 2,000,000 and 3,000,000 estimated number of persons. The value for 2,000,000 estimated persons was 62.4 and for 3,000,000 estimated persons was 67.1. The second interpolation was between these two values to get the value corresponding to 2,898,000 persons.

Using the second method with b = 3,203 from table C-4, the approximate standard error is

$$s_x = \sqrt{-\frac{3{,}203}{7{,}405{,}000}(2{,}898{,}000)^2 + (3{,}203)(2{,}898{,}000)} = 75{,}000$$

The 90-percent confidence interval for this estimate is from 2,778,000 to 3,018,000, i.e., 2,898,000 ± 1.6(75,000). Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Estimated Percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameter from table C-4 indicated by the numerator.

The approximate standard error, $s_{x,p}$, of an estimated percentage can be obtained by use of the formula

$$s_{x,p} = fs$$

In this formula, f is the appropriate factor from table C-4, and s is the standard error of the estimate obtained by interpolation from table C-3.

Alternatively, formula (4) will provide more accurate results. The standard errors in table C-3 were calculated with this formula.

$$s_{x,p} = \sqrt{\frac{b}{x} p(100-p)}$$

Here x is the total number of persons, families, households, or unrelated individuals in the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table C-4 associated with the characteristic in the numerator of the percentage.

Illustration. As shown in Table 1, of the 14,189,000 persons aged 18 to 21, 39.7 percent were enrolled in college in 1989. Using formula (3) with f = 1.0, and s = 0.7 interpolating from table C-3, the approximate standard error is

$$s_{x,p} = (1.0)(0.7) = 0.7$$

Using the alternate method with b = 2,814 from table C-4, the approximate standard error on an estimate of the percent of 18 to 21 year olds enrolled in school is

$$s_{x,p} = \sqrt{\frac{2{,}814}{14{,}189{,}000} (39.7)(100.0-39.7)} = 0.7$$

The 90-percent confidence interval for the estimated percentage of persons aged 18 to 21 in 1989 enrolled in college is from 38.6 to 40.8 percent, i.e., 39.7 ± 1.6(0.7).

Standard Error of a Difference. The standard error of the difference between two sample estimates is approximately equal to

$$s_{x-y} = \sqrt{s_x^2 x + s_y^2}$$

where s_x and s_y are the standard errors of the estimates, x and y. The estimates can be numbers, percentages, ratios, etc. This will result in accurate estimates of the standard error of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration. In October 1989, of the 6,995,000 males 18 to 21 years old, 37.9 percent were enrolled in college and of the 7,194,000 females of the same age group, 41.5 percent were enrolled in college. The apparent difference is 3.6 percent. Using formula (4) and b = 2,814 from table C-4, the standard error on the estimate of 37.9 percent is 1.0. Using formula (4) and b = 2,814 from table C-4, the standard error on the estimate of 41.5 percent is 1.0.

Therefore using formula (5) the standard error of the estimated difference of 3.6 percent is about:

$$s_{x-y} = \sqrt{(1.0)^2 + (1.0)^2} = 1.4$$

This means that the 90-percent confidence interval around the difference is from 1.4 to 5.8 percent, i.e., 3.6 ± 1.6(1.4). Since the interval does not contain zero, we can conclude with 90-percent confidence that the proportion of females aged 18 to 21 enrolled in college is greater than that for males.

Table C-1. 1989 Standard Errors of Estimated Numbers: Total or White

(Numbers in thousands)

Size of estimate	Total persons in age group									
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000

Table C-4. 1989 Standard Error Parameters for School Enrollment

Characteristic	Total or White		Black		Hispanic	
	b	f	b	f	b	f
Persons Enrolled in School:						
Total	2,814	1.0	3,807	1.0	7,509	1.0
Children 13 and under	3,203	1.1	3,203	0.9	3,203	0.6
Marital Status	5,319	1.4	7,631	1.4	15,072	1.4
Household Characteristics:						
Head, Wife, or Primary Individual	2,111	0.9	1,907	0.7	3,767	0.7
Child or Other Relative in Primary Family, Secondary Family Member	5,319	1.4	7,631	1.4	15,072	1.4
Income, Earnings	2,505	0.9	2,864	0.9	5,657	0.9
Employment Status, Occupation:						
Both Sexes	2,762	1.0	2,762	0.9	2,912	0.6
Male	2,390	0.9	2,390	0.8	2,390	0.6
Female	2,048	0.9	2,048	0.7	2,048	0.5

Notes: To estimate standard errors for school enrollment prior to 1989, multiply the standard error for 1989 by the appropriate factor in table C-5.
The b parameters should be multiplied by 1.5 for nonmetropolitan residence categories.
The b parameters should be multiplied by 1.91 for farm parameters.
For regional data, multiply the standard error calculated by the appropriate factor in table C-6.

Table C-5. Factors to Calculate School Enrollment Standard Errors Prior to 1989

Year	Total or White	Black	Hispanic
1988	1.00	1.00	1.00
1985-1987	0.92	0.92	0.85
1982-1984	0.92	0.92	0.59
1977-1981	0.87	0.87	0.56
1967-1976	0.86	0.86	0.55
1957-1966	1.06	1.06	(X)
Before 1956	1.30	1.30	(X)

Notes: Apply the appropriate factor to the standard error calculated for 1989.
Use the Total or White factors to calculate standard errors for children 13 and under.
